# Stock Gears

Spur Gears

Bevel Gears

Miter Gears

Worm and Worm Gears

Gear Rack

GEARS

# Stock Gears Numbering System

Letters (Prefix) Indicate Material and Type Gear.  
 Letters (Suffix) Indicate Hardened, Number of Threads, Direction of Rotation and KW and SS.  
 Numbers Indicate Pitch, Number of Teeth, and Ratio (Suffix).

## Spur Gears

S=Steel  
 TS=Steel 20°  
 C=Cast  
 TC=Cast 20°  
 H=Hardened Teeth  
 NM=Non-Metallic  
 Note: Pressure Angle is Shown as a Suffix to Part Number of All Our Spur Gears.

## Rack

R=Rack — Steel  
 RA=Rack — Steel Heavy Backing  
 TR=Rack — Steel 20° Heavy Backing  
 R20=Rack — Steel 20° Wide Face

## Bevel Gears

B=Bevel — Cast Iron Gears  
 B=Bevel — Steel Pinions  
 BS=Bevel — Steel Gears  
 BS=Bevel — Steel Pinions  
 Note: B Steel Pinions May Run With BS Gears of Same Ratio

## Miter Gears

M=Miter — Steel Gears  
 A or B=Larger Bore (Suffix)  
 HM=Miter-Hardened Teeth  
 K=KW & SS

## Worm

W=Worm — Steel  
 WH=Worm — Steel With Hub Projection  
 WG=Worm — Steel Hardened Ground Threads  
 WHG=Worm — Steel Hardened Ground Threads With Hub Projection  
 L=(Prefix) Longer Face  
 D or Q=(Suffix) Double or Quadruple Thread  
 R=Right Hand

## Worm Gears

W=Worm Gear — Cast Iron  
 WB=Worm Gear — Bronze  
 D or Q=Double or Quadruple Thread (Suffix)  
 R=Right Hand (Suffix)

## Examples

S620-14½° (Steel 6P 20T-14½°PA)  
 TS620-20° (Steel 6P 20T-20°PA)  
 C660-14½° (Cast 6P 60T-14½°PA)  
 TC660-20° (Cast 6P 60T-20°PA)  
 S620H-14½° (Steel 6P 20T-Hardened 14½°PA)  
 NM620-14½° (Non-Metallic 6P 20T-14½°PA)

## Examples

R-6X2 (14½° STD Backing 6PX2' Long)  
 RA-6X4 (14½° Heavy Backing 6PX4' Long)  
 TR-6X6 (20° STD Width 6PX6' Long)  
 R20-6X6 (20° Wide Face 6PX6' Long)

## Examples

B1040-2 (Cast 10P 40T 2:1 Ratio)  
 B1020-2 (Steel 10P 20T 2:1 Ratio)  
 BS1040-2 (Steel 10P 40T 2:1 Ratio)  
 BS1020-2 (Steel 10P 20T 2:1 Ratio)

## Examples

M824 (Steel 8P 24T)  
 M824A (Steel 8P 24T Larger Bore)  
 M2424BR (Brass 24P 24T)  
 HM1020 (Steel-Hardened Teeth 10P 20T)  
 HMK1020 (Steel-Hardened 10P 20T With KW & SS)

## Examples

W6R (Steel 6P Right Hand)  
 WH6R (Steel with Hub Projection 6P Right Hand)  
 WG6R (Steel-Hardened Ground Threads 6P Right Hand)  
 WHG6R (Steel with Hub Projection Hardened Ground Threads 6P Right Hand)  
 LW6R (Steel Long Face 6P Right Hand)  
 W6DR (Steel 6P Double Thread Right Hand)

## Examples

W660R (Cast Iron 6P 60T Right Hand)  
 WB660R (Bronze 6P 60T Right Hand)  
 W660DR (Cast Iron 6P 60T Double Thread Right Hand)

**Type A**

- Plain Without Hubs
- All Steel

*Martin* Stock Spur Gears are available in five different styles. Steel Gears are furnished in plain style and plain style with hub. Cast gears are furnished, plain with hub, web with lightening holes, and spoke. Cast gears are machined on all operating surfaces. *Martin* cast gears are cast with larger hub to provide extra strength and to allow for larger bores.

Ratings are based on strength calculation. Basic static strength rating, or for hand operation of above gears, is approximately 3 times the 100 RPM rating.

• Designates stock sizes for this pitch.

Note: 1. Ratings to right of heavy line are not recommended, as pitch line velocity exceeds 1000 feet per minute. They should be used for interpolation purposes only.

2. Non-metallic gears are most commonly used for the driving pinion of a pair of gears, with mating gear made of Cast Iron or Steel, where pitch line velocities exceed 1000 FPM and are not subjected to shock loads.

Ratings are based on strength calculation. Basic static strength rating, or for hand operation of above gears, is approximately 3 times the 100 RPM rating.

• Designates stock sizes for this pitch.

Note: 1. Ratings to right of heavy line are not recommended, as pitch line velocity exceeds 1000 feet per minute. They should be used for interpolation purposes only.

2. Non-metallic gears are most commonly used for the driving pinion of a pair of gears, with mating gear made of Cast Iron or Steel, where pitch line velocities exceed 1000 FPM and are not subjected to shock loads.

STEEL  
CAST

Ratings are based on strength calculation. Basic static strength rating, or for hand operation of above gears, is approximately 3 times the 100 RPM rating.

• Designates stock sizes for this pitch.

Note: 1. Ratings to right of heavy line are not recommended, as pitch line velocity exceeds 1000 feet per minute. They should be used for interpolation purposes only.

2. Non-metallic gears are most commonly used for the driving pinion of a pair of gears, with mating gear made of Cast Iron or Steel, where pitch line velocities exceed 1000 FPM and are not subjected to shock loads.

Ratings are based on strength calculation. Basic static strength rating, or for hand operation of above gears, is approximately 3 times the 100 RPM rating.

• Designates stock sizes for this pitch.

Note: 1. Ratings to right of heavy line are not recommended, as pitch line velocity exceeds 1000 feet per minute. They should be used for interpolation purposes only.

2. Non-metallic gears are most commonly used for the driving pinion of a pair of gears, with mating gear made of Cast Iron or Steel, where pitch line velocities exceed 1000 FPM and are not subjected to shock loads.

*Martin* Rack is made from low carbon cold drawn steel. It is available in 14½° and 20° pressure angle in 2, 4, and 6 foot lengths. Allowance is made for cutting and machining. Pinions to run with the rack may be selected from the Spur Gear section of the catalog. Special rack can be supplied in other materials, sizes, and pitches.

# Bevel Gears

## 20° Pressure Angle

Bevel Gears are used as right angle drives where high efficiency is required. They are carried in stock as 1:1 to 6:1 ratios. Bevel Gears are cut with the long and short addendum system and 20 degree pressure angle to compensate for tooth undercut in gears and pinions having low numbers of teeth. Most all of

*Martin* Bevel Gears are cut with the Coniflex tooth form to allow for a slight misalignment at assembly and during operation. Gears should be mounted at the correct distance from the core of apex center with thrust bearings being used in back of hubs to absorb the backward thrust created in this type of gearing.

# Miter Gears

## 20° Pressure Angle

*Martin*

GEARS

Miter Gears are ordinarily used as right angle drives, transmitting horsepower between intersecting shafts at a 1:1 ratio. They are used where high efficiency is required. Only miters of the same number of teeth, pitch, and pressure angle can be operated together. More than two miters may be used in sets, as in a differential.

The thrust of Miter Gears causes the gears to separate; therefore, ball bearings or roller bearings should be used rather than sleeve bearings. Provisions should be made using thrust bearings to absorb backward thrust.

All standard stock Miter Gears must be mounted at right angles (90 degrees) for proper tooth bearing.

All *Martin* Miter and Bevel Gears are generated with the Coniflex tooth form. A slight misalignment of gears is permissible because of the localized tooth bearing running lengthwise along the gear tooth.

The mounting distance must be held in order to maintain proper backlash between gears. This will also insure that the ends of the gear teeth will be flush with each other. The use of a straight mineral oil as a lubricant is recommended for most Miter Gear applications.

*Martin* Stock Miter Gears are manufactured from .40 carbon steel.

The "M" Series is furnished unhardened with plain bore. The "HM" Series is furnished hardened teeth with plain bore. The "HMK" Series is furnished hardened teeth with keyway and setscrew for installation on the shaft.

Hardened Miter Gears have approximately 50% more horsepower capacity and provide greater gear wear than untreated gears.

All *Martin* Miter Gears are cut with the 20° pressure angle system. They will not operate with any other pressure angle system.

Right Hand Worm and Gear

Single, Double, Quadruple Thread Worms

**\*NOTE: SELF-LOCKING ABILITY**

There is often some confusion as to the self-locking ability of a worm and gear set. *Martin* worm gear sets, under no condition should be considered to hold a load when at rest. The statement is made to cover the broad spectrum of variables affecting self-locking characteristics of a particular gear set in a specific application. Theoretically, a worm gear will not back drive if the friction angle is greater than the worm lead angle. However, the actual surface finish and lubrication may reduce this significantly. More important, vibration may cause motion at the point of mesh with further reduction in the friction angle.

Generally speaking, if the worm lead angle is less than 5°, there is reasonable expectation of self-locking. Again, no guarantee should be made and customer should be advised. **If safety is involved, a positive brake should be used.**

Originally, worm gearing was used to secure, by compact means, a large reduction of speed between driving and driven shafts with a proportionate increase (except for frictional loss) in the torque of the driven shaft. Worm gearing is still used for this purpose, and frequently the wheel is driven by a single-thread worm of such low helix angle that the drive cannot be reversed; that is the wheel cannot drive the worm as the gearing automatically locks itself against backward rotation. (\*See note below.)

Although a multiple-threaded worm when applied under like conditions is much more efficient than a single-threaded worm, it does not follow that the multiple-threaded worm should always be used.

A single-threaded worm might be preferable when the most important requirement is to obtain a high ratio and especially if the worm must be self-locking.

When power is the primary factor, the multiple-threaded worms should be used.

LUBRICATION is an important factor when using worm gearing. An increase in heat generated means a decrease in efficiency. The amount of power which can be transmitted at a given temperature increases as the efficiency of the gearing increases.

MATERIALS for worm and worm gears are generally confined to steel for worms and bronze or cast iron for gears. When steel worms are run with bronze gears at high speeds, the worm is usually hardened with ground threads.

\* Ratings listed are for bronze worm gears operating with hardened and ground steel worms. For ratings of cast iron worm gears with hardened steel worm, multiply listed ratings by 30%. For cast iron with hardened and ground steel worm, multiply by 50%.

† Torque ratings in inch pounds.

# Gear Standards

Quality is the most important factor in buying a gear. We have established Standards and Tolerances to insure our customers of accurate, dependable and long-lasting gears. All gears are checked with precision pins to assure correct backlash and center distances.

**BACKLASH:** All stock gears are checked between centers for backlash. The recommended backlash for mating gears when assembled is:

3 DP .....	.009 — .014	10 DP .....	.003 — .005
4 DP .....	.007 — .011	12 DP .....	.003 — .005
5 DP .....	.006 — .009	16 DP .....	.002 — .004
6 DP .....	.005 — .008	20 DP .....	.002 — .004
8 DP .....	.004 — .006	24 DP .....	.002 — .004

**CONCENTRICITY** of pitch line with bore (Total Indicator Reading) is held within:

3 DP .....	.006	10 DP .....	.004
4 DP .....	.006	12 DP .....	.004
5 DP .....	.005	16 DP .....	.0025
6 DP .....	.005	20 DP .....	.0025
8 DP .....	.005	24 DP .....	.0025

Stock bores are reamed, honed or ground to a smooth finish and standard commercial tolerances or closer. For rust prevention on distributor's shelf and for better appearance when received by the user, all stock gears go through a special finishing process. They present a pleasing appearance when on display or on the shelf. They are not boxed. All gears are identified by part numbers.

Data**

**Spur Gear  
Gear Formulas  
Drive Selection  
Horsepower and Torque  
Tables**

## Stock Spur Gear Drive Selection

When designing a stock gear drive using the horsepower tables in Catalog 2001, the following steps must be taken:

- I. Find out these five necessary things:
  - a. Exact center distance in inches
  - b. Ratio and speeds
  - c. Service factor (from page G-84)
  - d. Actual horsepower
  - e. Bore sizes of both gears

- II. Determine Design Horsepower using formula:

$$DHP = HP \times SF$$

Where: DHP = Design Horsepower

HP = Actual Horsepower

SF = Service Factor (from page G-84)

- III. Determine Pitch Diameters using the formulas:

$$PD_1 = \frac{CD \times 2}{\text{Ratio} + 1}$$

$$PD_2 = PD_1 \times \text{Ratio}$$

Where:  $PD_1$  = Pitch Diameter of Pinion (small gear)

$PD_2$  = Pitch Diameter of Gear (large gear)

CD = Center Distance

- IV. Check the Center Distance:

$$CD = \frac{PD_1 + PD_2}{2}$$

- V. Select Pitch from Horsepower tables on pages G-25 — G-27.

- VI. Check Selected pitch for necessary Pitch Diameters.

- VII. Check Horsepower capacity of Large Gear.

- VIII. Check maximum bore capacity of selected Gears.

## Spur Gear Drive Selection II (Other Than Stock)

When designing a gear drive when horsepower and speeds exceed the stock gear tables on pages G-25 — G-27, the following steps must be taken:

I. We must obtain all of the following data:

- a. Exact center distance in inches
- b. Ratio and speeds
- c. Service factor (from page G-84)
- d. Actual horsepower
- e. Bore sizes of both gears

II. Determine Design Horsepower using formula:

$$DHP = HP \times SF$$

Where: DHP = Design Horsepower

HP = Actual Horsepower

SF = Service Factor (from page G-84)

III. Determine Pitch Diameters using the formulas:

$$PD_1 = \frac{CD \times 2}{\text{Ratio} + 1}$$

$$PD_2 = PD_1 \times \text{Ratio}$$

Where:  $PD_1$  = Pitch Diameter of Pinion (small gear)

$PD_2$  = Pitch Diameter of Gear (large gear)

CD = Center Distance

IV. Determine velocity using the formula:

$$V = .262 \times PD \times \text{RPM}$$

Where: V = Velocity in feet per minute @ pitch line

PD = Pitch Diameter

RPM = Revolutions per minute of either gear\*

V. Determine approximate pitch using the formula:

$$DP = \sqrt{\frac{3.1416 \times S \times 3 \times V \times .25}{DHP \times 27.5 (1200 + V)}}$$

Where: DP = Diametral Pitch

S = Safe Static Stress per Square Inch of material  
(see table one, page G-84)

V = Velocity in FPM

DHP = Design Horsepower

Note: To round off answers, go to the nearest DP  
(standard DP's larger than 3 DP are: 1 DP, 1¼ DP, 1½ DP, 1¾ DP, 2 DP, 2½ DP)

VI. Determine number of teeth on both gears:

$$N = PD \times DP$$

Where: N = Number of teeth

PD = Pitch Diameter of gear

DP = Diametral Pitch of gear

NOTE: Velocities of both gears will always be the same. When using the above formula make sure to use the proper speed (RPM) with the proper pitch diameter.

## Spur Gear Drive Selection II (Other Than Stock)

VII. Determine Face Width:

$$F = DP \left( \frac{DHP \times 33,000}{V} \right) \frac{1}{SY \left( \frac{600}{600 + V} \right)}$$

Where: F = Face Width

DP = Diametral Pitch

V = Velocity in FPM

S = Safe Static Stress per Square Inch of material  
(Table 1, page G-84)

Y = Outline formula from Table 2, page G-84

Note: To round off each answer, go to the next one inch.

VIII. Check HP rating of selected pinion using the formula:

$$HP = \frac{LV}{33,000}$$

Where:  $L = \frac{SYF}{DP} \times \frac{600}{600 + V}$

From horsepower formulas on page G-83.

Note: If the horsepower capacity is below the design horsepower, the following options can be taken:

- A. Harden pinion (check gear HP capacity first)
- B. Increase face
- C. Increase pitch

## Center Distance, Pitch Diameters and Ratios of Spur Gears

To determine the pitch diameters of a gear set, we must find two basic things:

1. Required ratio
2. Required center distance

Knowing this, first figure out the pitch diameter of the pinion (smaller gear) using the formula:

$$PD_1 = \frac{CD \times 2}{\text{Ratio} + 1}$$

Where:  $PD_1$  = Pitch Diameter of the Pinion

CD = Center Distance

Then, find the pitch diameter of the larger gear,  $PD_2$ , by using the formula:

$$PD_2 = PD_1 \times \text{Ratio}$$

Then check the center distance by using the formula:

$$CD = \frac{PD_1 + PD_2}{2}$$

## Horsepower Formulas

See page G-84 for tables one, two and three

### Engineering Data

Lewis Formula (with Barth Revision)

L = Load in pounds at pitch line

S = Safe static stress per square inch of material  
(see table one)

DP = Diametral Pitch

F = Face width of gear

Y = Strength factor based on Pressure Angle and Number  
of Teeth (See table two)

V = Velocity in feet per minute  
 $V = .262 \times PD \times RPM$

PD = Pitch Diameter

RPM = Revolutions Per Minute

HP = Horsepower

$$L = \frac{SFY}{DP} \times \frac{600}{600 + V}$$

Maximum allowable torque (T) that should be imposed on a gear will be the safe tooth load (L) multiplied by

$$\frac{DP}{2} \text{ or } T = \frac{L \times PD}{2}$$

The safe Horsepower capacity of the gear (at a given RPM) can be calculated from  $HP = \frac{T \times RPM}{63,025}$  or directly from (L) and (V):

$$*HP = \frac{LV}{33,000}$$

$$\text{For a known HP, } T = \frac{63025 \times HP}{RPM}$$

For NON-METALLIC GEARS, the modified Lewis Formula shown below may be used with (S) values of 6000 PSI for Phenolic Laminated material.

$$L = \frac{SFY}{DP} \left( \frac{150}{200 + V} + .25 \right)$$

\* Apply SERVICE FACTOR (table three) for required horsepower.

# Gear Standards

**Table Three**

Service factors

Multiply required horsepower by service factor recommended for type of service

Type of Load	Intermittent or 3 Hours per Day	8-10 Hours per Day	Continuous 24 Hours per Day
UNIFORM	.80	1.00	1.25
LIGHT SHOCK	1.00	1.25	1.50
MEDIUM SHOCK	1.25	1.50	1.80
HEAVY SHOCK	1.50	1.80	2.00

## Rules and Formulas For Spur Gear Calculations

**Diametral Pitch**  
**Diametral Pitch is the Number of Teeth to Each Inch of the Pitch Diameter.**

To Find	Having	Rule	Formula
The Diametral Pitch	The Circular Pitch	Divide 3.1416 by the Circular Pitch	$DP = \frac{3.1416}{CP}$
The Diametral Pitch	The Pitch Diameter and the Number of Teeth	Divide the Number of Teeth by Pitch Diameter	$DP = \frac{N}{D'}$
The Diametral Pitch	The Outside Diameter and Number of Teeth	Divide the Number of Teeth plus 2 by Outside Diameter	$DP = \frac{N+2}{D}$
Pitch Diameter	The Number of Teeth and the Diametral Pitch	Divide Number of Teeth by the Diametral Pitch	$D' = \frac{N}{P}$
Pitch Diameter	The Number of Teeth and Outside Diameter	Divide the product of Outside Diameter and Number of Teeth by Number of Teeth plus 2	$D' = \frac{DN}{N+2}$
Pitch Diameter	The Outside Diameter and the Diametral Pitch	Subtract from the Outside Diameter the Quotient of 2 Divided by the Diametral Pitch	$D' = D - \frac{2}{P}$
Pitch Diameter	Addendum and the Number of Teeth	Multiply Addendum by the Number of Teeth	$D' = sN$
Outside Diameter	The Number of Teeth and the Diametral Pitch	Divide number of Teeth plus 2 by the Diametral Pitch	$D = \frac{N+2}{P}$
Outside Diameter	The Pitch Diameter and the Diametral Pitch	Add to the Pitch Diameter the quotient of 2 divided by the Diametral Pitch	$D = D' + \frac{2}{P}$
Outside Diameter	The Pitch Diameter and the Number of Teeth	Divide the Number of Teeth plus 2 by the quotient of Number of Teeth divided by Pitch Diameter	$D = \frac{N+2}{N \div D'}$
Outside Diameter	The Number of Teeth and Addendum	Multiply the Number of Teeth plus 2 by Addendum	$D = (N+2)s$
Number of Teeth	The Pitch Diameter and the Diametral Pitch	Multiply the Pitch Diameter by the Diametral Pitch	$N = D'P$
Number of Teeth	The Outside Diameter and the Diametral Pitch	Multiply Outside Diameter by the Diametral Pitch and subtract 2	$N = DP - 2$
Thickness of Tooth	The Diametral Pitch	Divide 1.5708 by the Diametral Pitch	$t = \frac{1.5708}{P}$
Addendum	The Diametral Pitch	Divide 1 by the Diametral Pitch or $A = \frac{D'}{N}$	$A = \frac{1}{P}$
Dedendum	The Diametral Pitch	Divide 1.157 by the Diametral Pitch	$A+L = \frac{1.157}{P}$
Working Depth	The Diametral Pitch	Divide 2 by the Diametral Pitch	$WD = \frac{2}{P}$
Whole Depth	The Diametral Pitch	Divide 2.157 by the Diametral Pitch	$D'' = \frac{2.157}{P}$
Clearance	The Diametral Pitch	Divide .157 by the Diametral Pitch	$L = \frac{.157}{P}$
Clearance	Thickness of Tooth	Divide Thickness of Tooth at Pitch Line by 10	$L = \frac{t}{10}$

NOTE: Rules and Formulas Relating to Tooth Depth and Outside Diameter Apply to Full-Depth, Equal Addendum Gears.

\*NOTE: Dimensions listed are for HOB CUT TEETH ONLY. Shaper cut teeth may be slightly larger. Consult factory for exact measurement.

**All Gears In Stock Are Diametral Pitch**

## Rules and Formulas For Spur Gear Calculations

### Circular Pitch

**Circular Pitch is the Distance from the Center of One Tooth to the Center of the Next Tooth, Measured Along the Pitch Circle.**

To Find	Having	Rule	Formula
The Circular Pitch	The Diametral Pitch	Divide 3.1416 by the Diametral Pitch	$C' = \frac{3.1416}{DP}$
The Circular Pitch	The Pitch Diameter and the Number of Teeth	Divide Pitch Diameter by the product of .3183 and Number of Teeth	$C' = \frac{PD}{.3183N}$
The Circular Pitch	The Outside Diameter and the Number of Teeth	Divide Outside Diameter by the product of .3183 and Number of Teeth plus 2	$C' = \frac{OD}{.3183N + 2}$
Pitch Diameter	The Number of Teeth and the Circular Pitch	The continued product of the Number of Teeth, the Circular Pitch and .3183	$D' = NC' .3183$
Pitch Diameter	The Number of Teeth and the Outside Diameter	Divide the product of Number of Teeth and Outside Diameter by Number of Teeth plus 2	$D = \frac{N \times OD}{N + 2}$
Pitch Diameter	The Outside Diameter and the Circular Pitch	Subtract from the Outside Diameter the product of the Circular Pitch and .6366	$D' = OD - (C' .6366)$
Pitch Diameter	Addendum and the Number of Teeth	Multiply the Number of Teeth by the Addendum	$D' = NA$
Outside Diameter	The Number of Teeth and the Circular Pitch	The continued product of the Number of Teeth plus 2, the Circular Pitch and .3183	$D = (N + 2) C' .3183$
Outside Diameter	The Pitch Diameter and the Circular Pitch	Add to the Pitch Diameter the product of the Circular Pitch and .6366	$D = PD + (C' .6366)$
Outside Diameter	The Number of Teeth and the Addendum	Multiply Addendum by Number of Teeth plus 2	$D = A (N + 2)$
Number of Teeth	The Pitch Diameter and the Circular Pitch	Divide the product of Pitch Diameter and 3.1416 by the Circular Pitch	$N = \frac{PD \ 3.1416}{C'}$
Thickness of Tooth	The Circular Pitch	One-half the Circular Pitch	$t = \frac{C'}{2}$
Addendum	The Circular Pitch	Multiply the Circular Pitch by .3183 or $s = \frac{D'}{N}$	$A = C' .3183$
Dedendum	The Circular Pitch	Multiply the Circular Pitch by .3683	$A + L = C' .3683$
Working Depth	The Circular Pitch	Multiply the Circular Pitch by .6366	$WD = C' .6366$
Whole Depth	The Circular Pitch	Multiply the Circular Pitch by .6866	$D'' = C' .6866$
Clearance	The Circular Pitch	Multiply the Circular Pitch by .05	$L = C' .05$
Clearance	Thickness of Tooth	One-Tenth the Thickness of Tooth at Pitch Line	$L = \frac{t}{10}$

NOTE: Rules and Formulas Relating to Tooth Depth and Outside Diameter Apply to Full-Depth, Equal Addendum Gears.

All Circular Pitch Gears Are Made-To-Order

## Rules and Formulas For Module (Metric) Spur Gear Calculations

(Module Represents the Amount of Pitch Diameter per Tooth)

To Find	Having	Rule	Formula
Metric Module	Pitch Diameter and Number of Teeth	Divide Pitch Diameter in Millimeters by the Number of Teeth	$M = \frac{PD \text{ (Millimeters)}}{N}$
Metric Module	Circular Pitch in Millimeter	Divide Circular Pitch in Millimeters by Pi (3.1416)	$M = \frac{C \text{ (Millimeters)}}{3.1416}$
Metric Module	Diametral Pitch	Divide 25.4 by Diametral Pitch	$M = \frac{25.4}{DP}$
Metric Module	Outside Diameter and Number of Teeth	Divide Outside Diameter (in Millimeters) by the Number of Teeth plus 2	$M = \frac{OD}{N + 2}$
Pitch Diameter	Module and Number of Teeth	Multiply Module by Number of Teeth	$D' \text{ (In MM)} = M \times N$
Pitch Diameter	Number of Teeth and Outside Diameter	Divide the product of Outside Diameter and No. of Teeth by No. of Teeth plus 2	$D' = \frac{OD \times N}{N + 2}$
Pitch Diameter	Outside Diameter and the Module	Multiply Module by 2 and Subtract from Outside Diameter	$D' = OD - 2M$
Outside Diameter	Module and Number of Teeth	Number of Teeth plus 2 Multiplied by Module	$OD \text{ (In MM)} = (N + 2) \times M$
Diametral Pitch	Module	Divide 25.4 by Module	$DP = \frac{25.4}{M}$
Circular Pitch	Module	Multiply Module by Pi (3.1416)	$C' \text{ (In MM)} = M \times 3.1416$
Addendum	Module Known	The Addendum equals the Module	$A = M$
Whole Depth	Module Known	Multiply 2.157 by Module	$D'' \text{ (In MM)} = 2.157 \times M$
Thickness of Tooth	Module and Outside Diameter	Multiply Pitch Diameter (in Millimeters) by the Sine of the Angle of 90 Divided by the Number of Teeth	$t \text{ (In MM)} = PD \text{ (MM)} \times \text{Sine } \frac{90}{N}$
English Module	Pitch Diameter in Inches and Number of Teeth	Divide Pitch Diameter in Inches by Number of Teeth	$M = \frac{PD \text{ (Inches)}}{N}$ (Answer in Fraction)

NOTE: Rules and Formulas Relating to Tooth Depth and Outside Diameter Apply to Full-Depth, Equal Addendum Gears.

# Module Pitch Tooth Dimensions

† Dedendum and total depth when clearance = 0.1666 x module, or one-sixth module.

‡ Total Depth equivalent to American standard full-depth teeth. (Clearance = 0.157 x Module.)

To Find	Rule	Formula
Pitch Diameter	Divide Number of Teeth by Diametral Pitch	Pitch Diameter = $\frac{\text{Number of Teeth}}{\text{Diametral Pitch}}$
Tangent of Pitch Angle Of Driven	Divide Number of Teeth in Driven by Number of Teeth in Driver	Tangent Pitch Angle of Driven = $\frac{\text{Number of Teeth in Driven}}{\text{Number of Teeth in Driver}}$ = Ratio
Pitch Angle of Driver	Subtract Pitch Angle of Driven from 90 Degrees	Pitch Angle Of Driver = 90 Degrees - Pitch Angle of Driven
Pitch Cone Radius	Divide Pitch Diameter by Twice the Sine of the Pitch Angle	Pitch Cone Radius = $\frac{\text{Pitch Diameter}}{2 \times \text{Sine Pitch Angle}}$
Tangent of Addendum Angle	Divide Addendum by the Pitch Cone Radius	Tangent of Addendum Angle = $\frac{\text{Addendum}}{\text{Pitch Cone Radius}}$
Face Angle	Add Addendum Angle to Pitch Angle	Face Angle = Addendum Angle + Pitch Angle
Tangent of Dedendum Angle	Divide Dedendum by the Pitch Cone Radius	Tangent of Dedendum Angle = $\frac{\text{Dedendum}}{\text{Pitch Cone Radius}}$
Root Angle	Subtract Dedendum Angle from Pitch Angle	Root Angle = Pitch Angle - Dedendum Angle
Angular Addendum	Multiply Addendum by Cosine of Pitch Angle	Angular Addendum = Addendum x Cosine Pitch Angle
Outside Diameter	Add 2 Angular Addenda to Pitch Diameter	Outside Diameter = 2 Angular Addenda x Pitch Diameter
Mounting Distance	Add one-half the Pitch Diameter of Mating to Pitch Line	Mounting Distance = $\frac{\text{Pitch Diameter of Mate}}{2}$ + Backing to Pitch Line
Distance From Cone Center to Crown	Multiply one-half Outside Diameter by Co-tangent of Face Angle	Cone Center to Crown = $\frac{\text{Outside Diameter}}{2}$ x Co-Tangent Face Angle
Backing to Crown	Subtract Cone Center to Crown from Mounting Distance	Backing to Crown = Mounting Distance - Cone Center to Crown
Ratio	Divide Teeth in Driven by Teeth in Driver	Ratio = $\frac{\text{Number of Teeth in Driven}}{\text{Number of Teeth in Driver}}$

# Formula For Worm Gears

## (Based On Diametral Pitch)

To Find	Rule	Formula
Worm Gear Pitch Diameter	Divide Number of Teeth by Diametral Pitch	$\text{Pitch Diameter} = \frac{\text{Number of Teeth in Worm Gear}}{\text{Diametral Pitch}}$
Worm Gear Throat Diameter	Add 2 Addenda to Pitch Diameter	$\text{Throat Diameter} = (2 \times \text{Addendum}) + \text{Pitch Diameter}$
Worm Gear Outside Diameter	Add 3 Addenda to Pitch Diameter	$\text{Outside Diameter} = (3 \times \text{Addendum}) + \text{Pitch Diameter}$
Worm Pitch Diameter	Subtract the Worm Gear Pitch Diameter from Twice the Center Distance	$\text{Worm Pitch Diameter} = (2 \times \text{Center Distance}) - \text{Worm Gear Pitch Diameter}$
Worm Outside Diameter	Add 2 Addenda to Worm Pitch Diameter	$\text{Worm Outside Diameter} = \text{Worm Pitch Diameter} + 2 \times \text{Addendum}$
Worm Lead	Divide 3.1416 by Diametral Pitch and Multiply by Number of Threads in Worm	$\text{Worm Lead} = \frac{3.1416}{\text{Diametral Pitch}} \times \text{Number of Threads in Worm}$
Co-Tangent of Worm Helix Angle	Multiply Worm Pitch Diameter by Diametral Pitch and Divide by Number of Worm Threads	$\text{Co-Tangent Worm Helix Angle} = \frac{\text{Worm Pitch Diameter} \times \text{Diametral Pitch}}{\text{Number Worm Threads}}$
Center Distance	Add Worm Pitch Diameter to Worm Gear Pitch Diameter and Divide Sum by 2	$\text{Center Distance} = \frac{\text{Worm Pitch Diameter} + \text{Worm Gear Pitch Diameter}}{2}$
Ratio	Divide Number of Teeth in Worm Gear by Number of Worm Threads	$\text{Ratio} = \frac{\text{Number of Teeth in Worm Gear}}{\text{Number of Worm Threads}}$

NOTE: Tooth data (Addendum, Full Depth, Etc.) is same as for Spur Gears.

### Comparative Sizes of Involute Gear Teeth

### Gear Rack Comparison — 14½ and 20°

## Stock Steel Gears

*Martin* steel gears are manufactured from high quality carbon steel material. This material is used for strength and good hardening characteristics. These gears may be hardened by any method acceptable to good practice such as flame or induction hardening. Flame hardening is preferred so that only the teeth are hardened. Distortion is virtually eliminated and the bore is left soft for subsequent work.

## Cast Gears

*Martin* cast iron gears are manufactured from high quality close grained controlled specification irons.

## Reboring of Stock Gears

Most of *Martin's* Stock Gears may be rebored. The maximum recommended bore size is given for each gear. In reboring gears, care must be taken to hold the bore concentric with the pitch diameter. In most cases this would require a great amount of time. To cut costly set-up time when reboring, *Martin* holds the outside diameter of its gears concentric with the bore which in turn is concentric with the pitch diameter. The outside diameter is held to a closer total indicator reading than the pitch diameter. In the finer pitches, care should be taken not to distort the outside diameter when chucking.

*Martin's* steel gears are machined all over.

Rebore or rework may be accomplished by chucking on the hub. Concentricity must be controlled in order for gears to run at maximum efficiency.
