SIEMENS

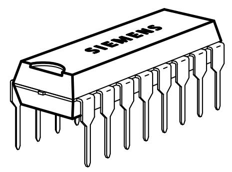
Phase Control IC

TCA 785

Bipolar IC

Features

- Reliable recognition of zero passage
- Large application scope
- May be used as zero point switch
- LSL compatible
- Three-phase operation possible (3 ICs)
- Output current 250 mA
- Large ramp current range
- Wide temperature range

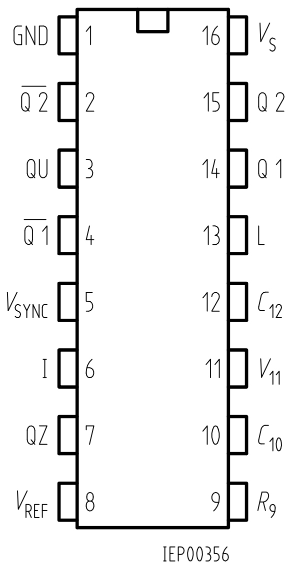


P-DIP-16-1

Type	Ordering Code	Package
TCA 785	Q67000-A2321	P-DIP-16-1

This phase control IC is intended to control thyristors, triacs, and transistors. The trigger pulses can be shifted within a phase angle between 0 ° and 180 °. Typical applications include converter circuits, AC controllers and three-phase current controllers.

This IC replaces the previous types TCA 780 and TCA 780 D.



Pin Configuration

Pin Definitions and Functions

Pin	Symbol	Function
1	GND	Ground
2 3 4	$\overline{Q2}$ Q U $\overline{Q2}$	Output 2 inverted Output U Output 1 inverted
5	V_{SYNC}	Synchronous voltage
6 7	I Q Z	Inhibit Output Z
8	V_{REF}	Stabilized voltage
9 10	R_9 C_{10}	Ramp resistance Ramp capacitance
11	V_{11}	Control voltage
12	C_{12}	Pulse extension
13	L	Long pulse
14 15	Q 1 Q 2	Output 1 Output 2
16	V_S	Supply voltage

Functional Description

The synchronization signal is obtained via a high-ohmic resistance from the line voltage (voltage V_5). A zero voltage detector evaluates the zero passages and transfers them to the synchronization register.

This synchronization register controls a ramp generator, the capacitor C_{10} of which is charged by a constant current (determined by R_9). If the ramp voltage V_{10} exceeds the control voltage V_{11} (triggering angle φ), a signal is processed to the logic. Dependent on the magnitude of the control voltage V_{11}, the triggering angle φ can be shifted within a phase angle of 0˚ to 180˚.

For every half wave, a positive pulse of approx. 30 µs duration appears at the outputs Q 1 and Q 2. The pulse duration can be prolonged up to 180˚ via a capacitor C_{12}. If pin 12 is connected to ground, pulses with a duration between φ and 180˚ will result.

Outputs $\overline{Q1}$ and $\overline{Q2}$ supply the inverse signals of Q 1 and Q 2.

A signal of φ +180˚ which can be used for controlling an external logic,is available at pin 3.

A signal which corresponds to the NOR link of Q 1 and Q 2 is available at output Q Z (pin 7).

The inhibit input can be used to disable outputs Q1, Q2 and $\overline{Q1}$, $\overline{Q2}$.

Pin 13 can be used to extend the outputs $\overline{Q1}$ and $\overline{Q2}$ to full pulse length (180˚ – φ).

Application Hints for External Components

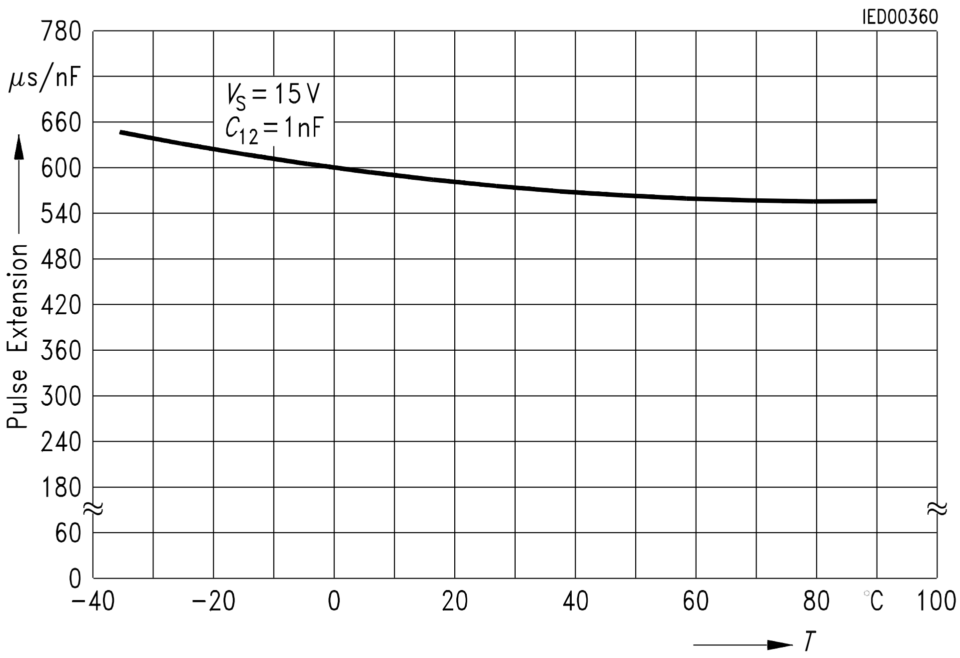
		min	max	
Ramp capacitance	C_{10}	500 pF	1 µF[1]	The minimum and maximum values of I_{10} are to be observed

Triggering point $t_{Tr} = \dfrac{V_{11} \times R_9 \times C_{10}}{V_{REF} \times K}$ [2]

Charge current $I_{10} = \dfrac{V_{REF} \times K}{R_9}$ [2]

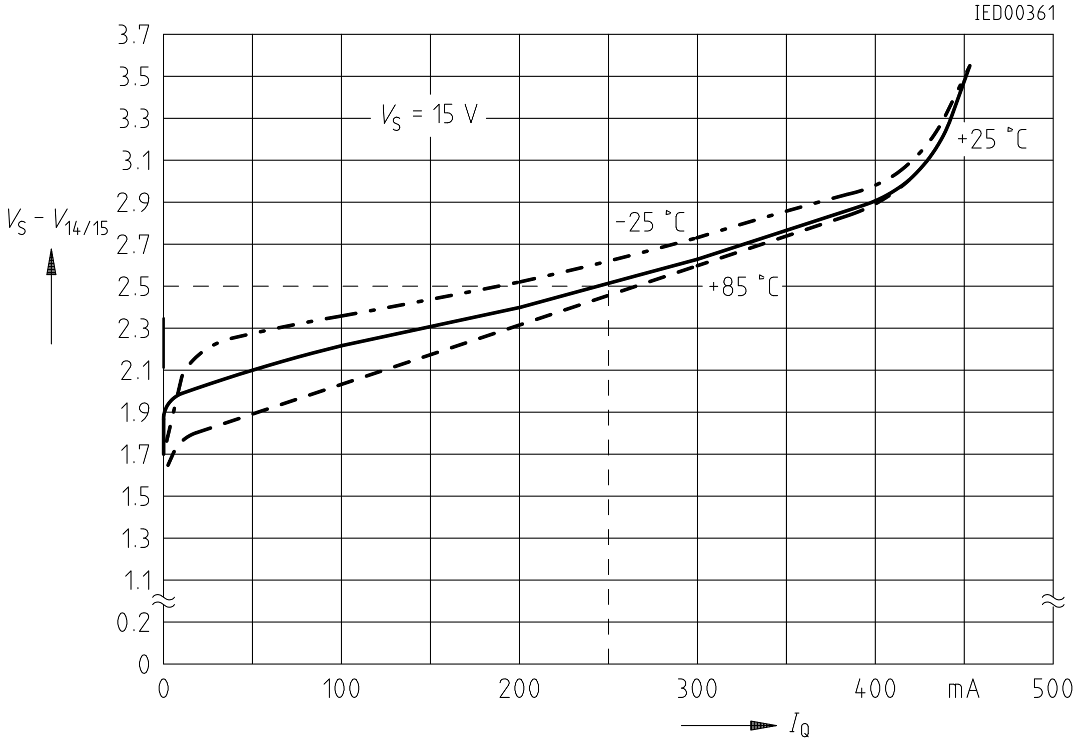
Ramp voltage
$V_{10\,max} = V_S - 2$ V $\quad V_{10} = \dfrac{V_{REF} \times K \times t}{R_9 \times C_{10}}$ [2]

Pulse Extension versus Temperature

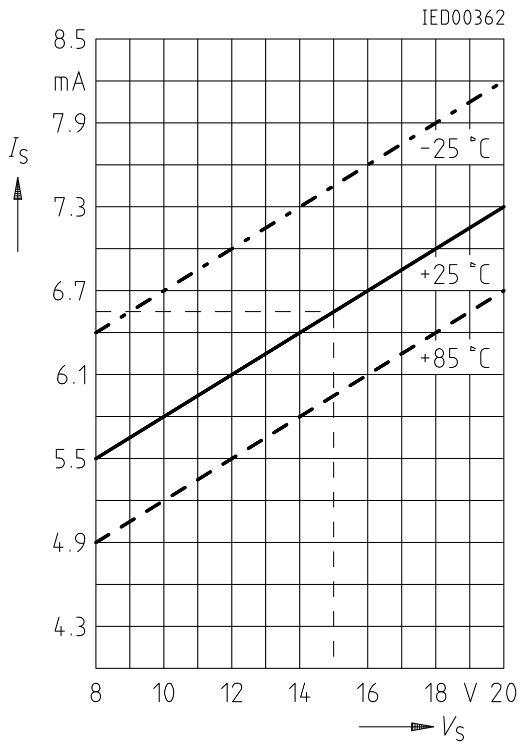


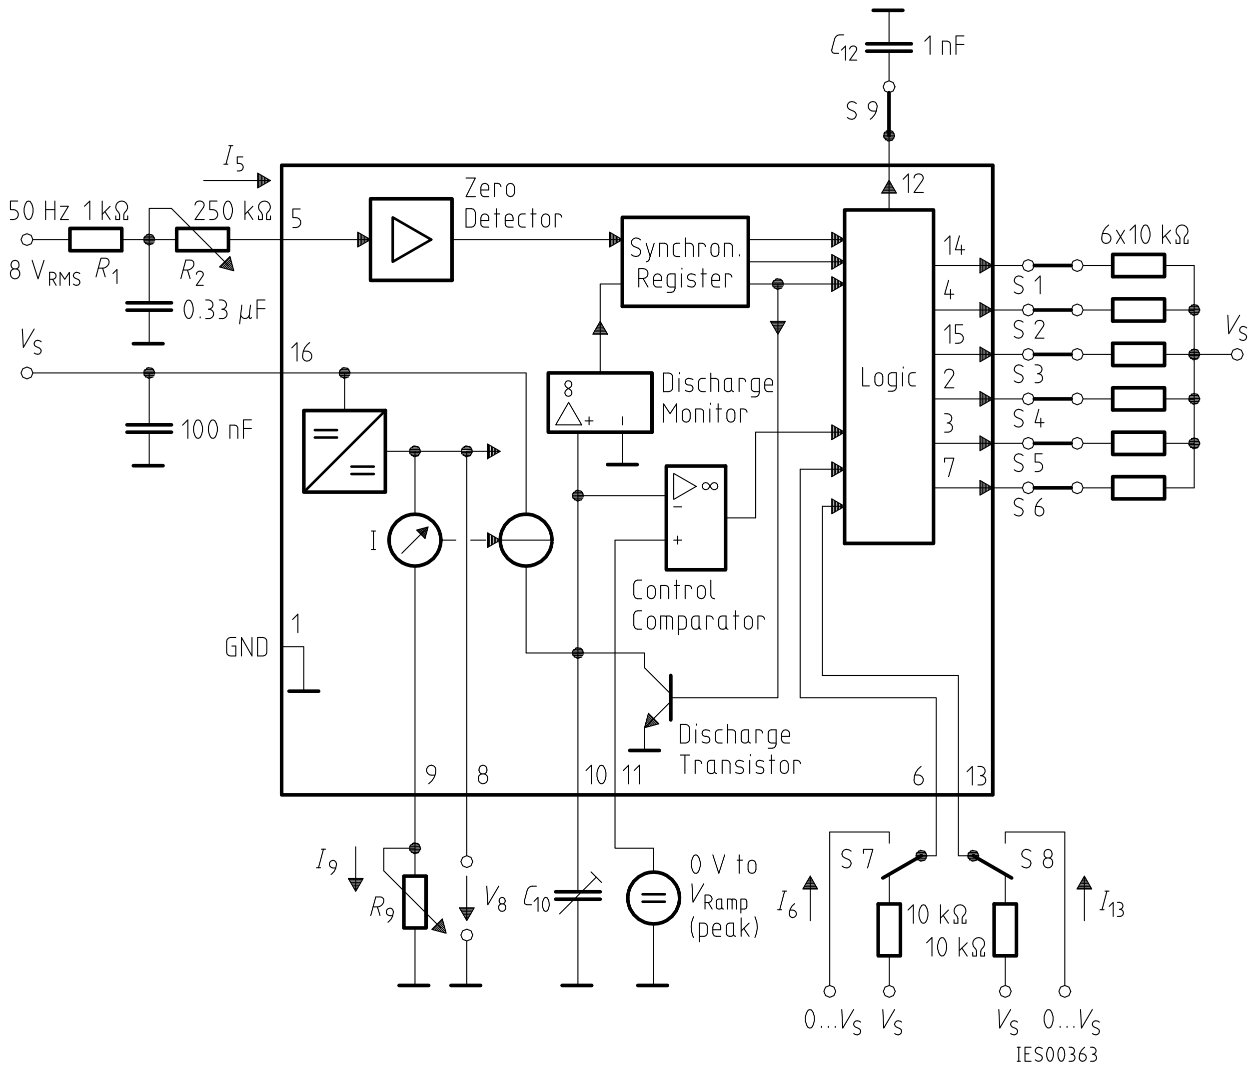
[1] Attention to flyback times
[2] $K = 1.10 \pm 20$ %

Output Voltage measured to + V_S



Supply Current versus Supply Voltage





It is necessary for all measurements to adjust the ramp with the aid of C_{10} and R_9 in the way that $3\,V \leq V_{ramp\,max} \leq V_S - 2\,V$
e.g. C_{10} = 47 nF; 18 V: R_9 = 47 kΩ; 8 V: R_9 = 120 kΩ

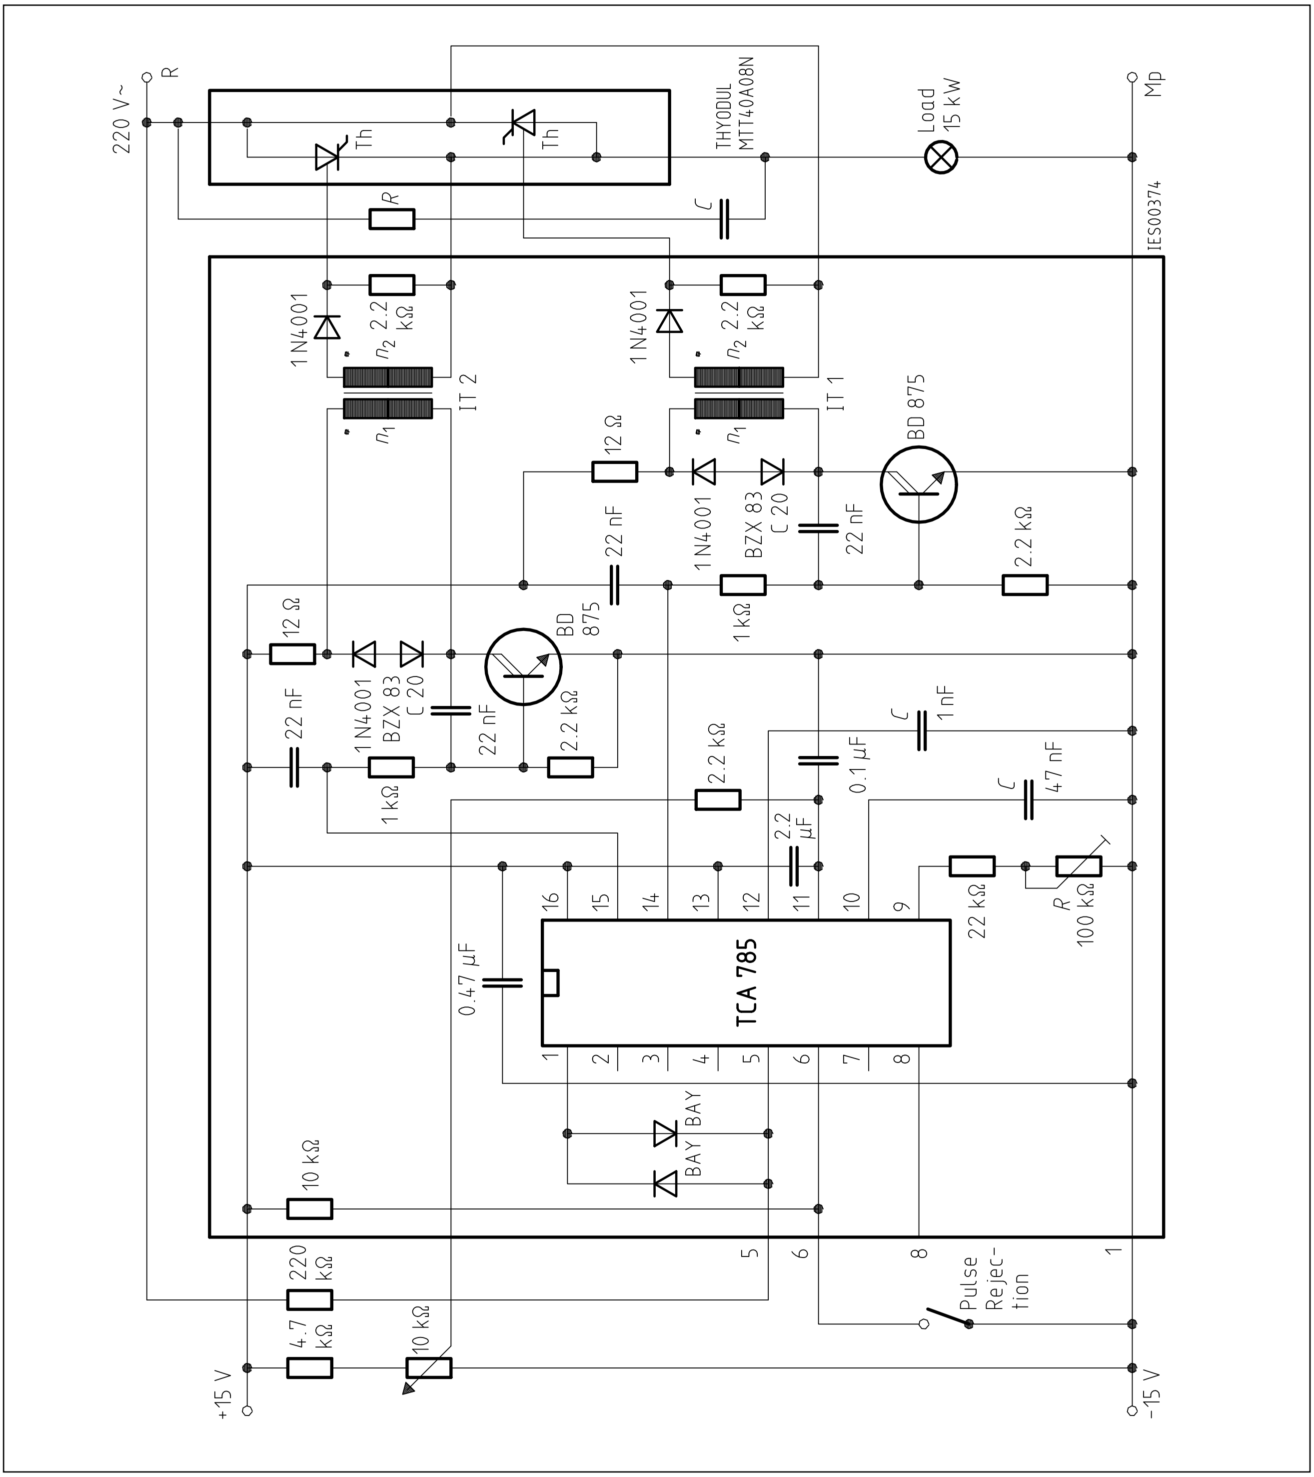
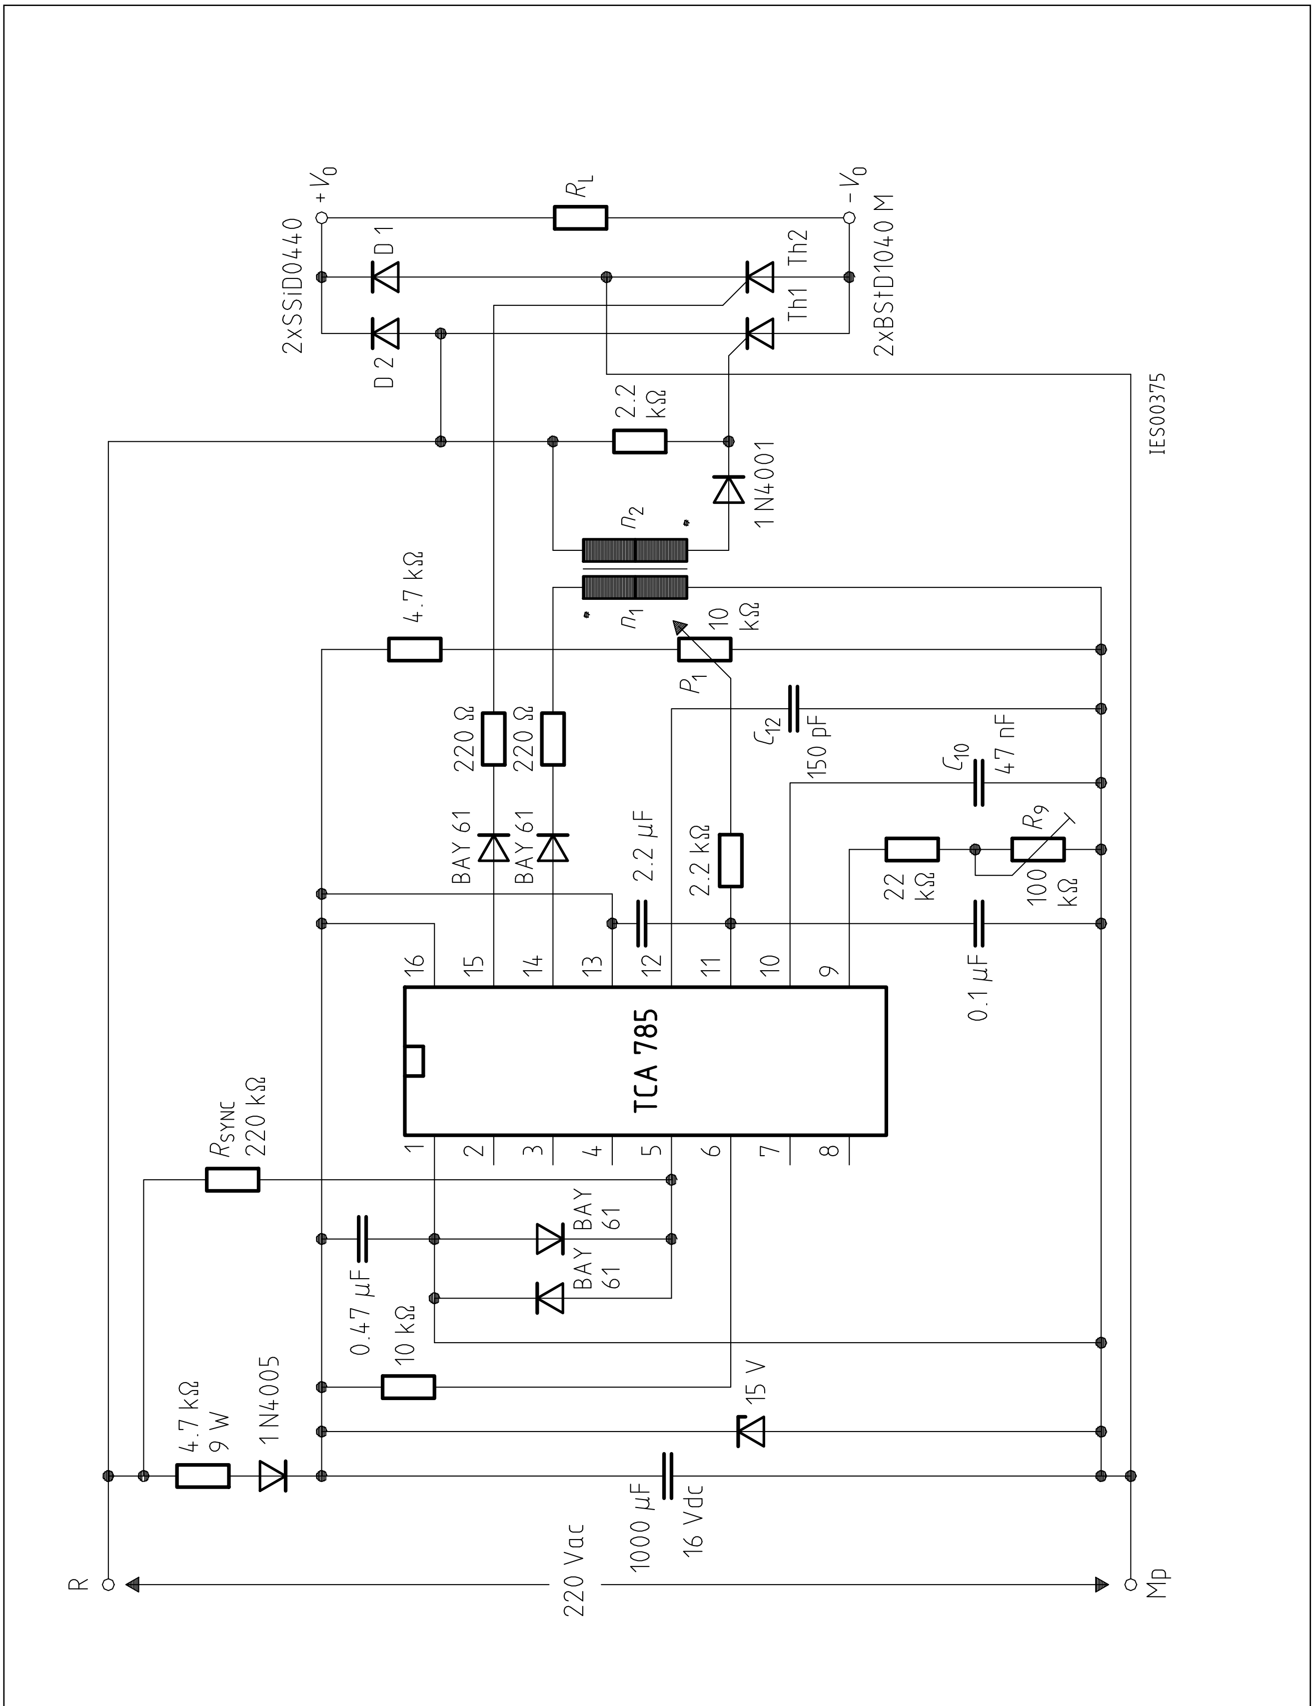
Application Examples
Triac Control for up to 50 mA Gate Trigger Current

A phase control with a directly controlled triac is shown in the figure. The triggering angle of the triac can be adjusted continuously between 0˚ and 180˚ with the aid of an external potentiometer. During the positive half-wave of the line voltage, the triac receives a positive gate pulse from the IC output pin 15. During the negative half-wave, it also receives a positive trigger pulse from pin 14. The trigger pulse width is approx. 100 µs.

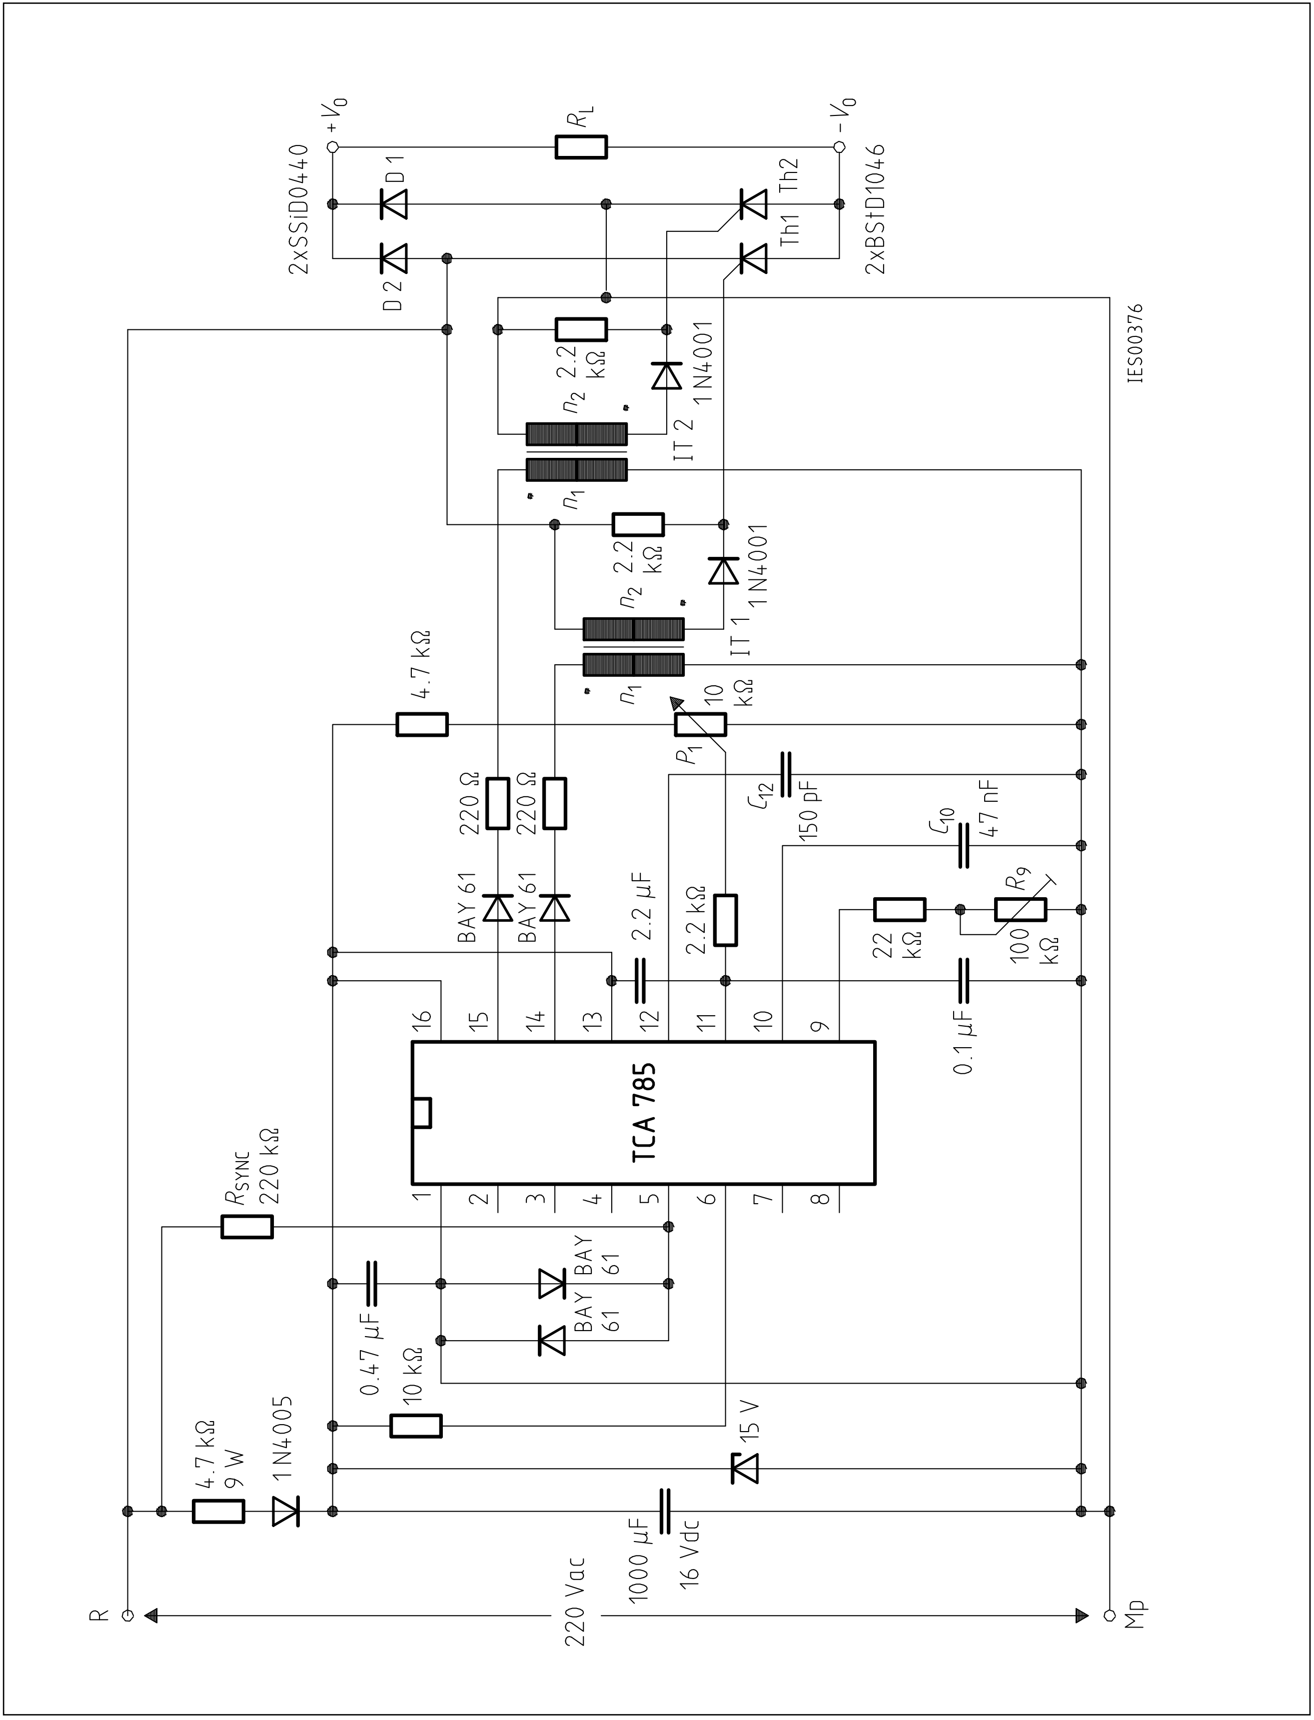


Fully Controlled AC Power Controller Circuit for Two High-Power Thyristors

Shown is the possibility to trigger two antiparalleled thyristors with one IC TCA 785. The trigger pulse can be shifted continuously within a phase angle between 0˚ and 180˚ by means of a potentiometer. During the negative line half-wave the trigger pulse of pin 14 is fed to the relevant thyristor via a trigger pulse transformer. During the positive line half-wave, the gate of the second thyristor is triggered by a trigger pulse transformer at pin 15.



Half-Controlled Single-Phase Bridge Circuit with Trigger Pulse Transformer and Direct Control for Low-Power Thyristors



Half-Controlled Single-Phase Bridge Circuit with Two Trigger Pulse Transformers for Low-Power Thyristors
